Design: Description of the experiment with the sample required and the number of conditions and any special sampling requests. Also add any special stimulus requests such as audio/video, images (photos, maps, graphs, etc.) or extended textual stimuli.

Provide specific subsampling instructions as needed (for example *block conditions by party id so that there are roughly equal numbers of Republicans and Democrats in each condition.*)

Sample: $n = [N]$ [general population subjects or brief subsample description if not general population] with $[k]$ items each for total of $[N \times k]$ respondent-items.

[IF ITEMS REQUESTED FROM PROFILE DATA, ADD: Please include profile items [*items from the profile data that are needed (you do not need to specify items included in the TESS standard delivery)*]]

Description of Study:

Here should be a list of the questions respondents will be given, with clear information about the randomization(s) that will be done and which questions will be given to which groups and which will be given to everyone. Again, it is vital that instructions are as clear as possible to ensure that cost estimates and instrument programming is done accurately.
